

epibrasion

using the non-dissolving epipin Performance

Cleanse

Cleanse with a product that suits your client's skin condition.

Epi(derma)brasion

In a small bowl, mix 1 tbsp Ferment Peeling (Papain) with water until it becomes fluffy and apply it to the chest, neck and face. Massage with wet fingertips for 1 minute. Any enzyme will be ok to use if it is similarly mild to Papain.

Slide on top of it with the epipin Performance on speed 5 WITHOUT applying PRESSURE. Re-moisten each area with wet fingertips before sliding on it. Use the 'tic tac toe' method per area as you know from diamond microdermabrasion. The enzymatic product creates a cushion between the skin and the PLA- pyramids of the Performance epipin to slough-off the Keratinocytes that the enzymes loosened.

Remove and proceed with the facial as usual.
